Model Name A95	A S A S
Family Model N/A	ST AT ST AT
Standards ETSI E	EN 300 328 V2.2.2 (2019-07)
This device described above has the equipment under test (EUT) i	been tested by Shenzhen NTEK, and the test results show that s in compliance with the 2014/53/EU RED Directive Art.3.2 e only to the tested sample identified in the report.
This report shall not be reproduc	ed except in full, without the written approval of Shenzhen NTEK,
	revised by Shenzhen NTEK, personnel only, and shall be noted in
the revision of the document.	X X AX X

Equipment	Mobile Phone
Trade Mark	Blackview
Model Name.	A95
Family Model	N/A 💉 🔶
Model Difference	N/A
	The EUT is Mobile Phone
	Operation Frequency: 2402~2480 MHz
	Modulation Type: GFSK
	Adaptive/non-adaptive Adaptive equipment
Product Description	Receiver categories 3
	Number Of Channel Please see Note 2.
	Antenna Designation: PIFA Antenna
	Antenna Gain(Peak) 1.28 dBi
	R K S
Channel List	Refer to below
Adapter	Model: HJ-FC001K7-EU Input: 100-240V~50/60Hz 0.6A Output: 5V3.0A 15.0W 9V2.0A 18.0W 12V1.5A 18.0W
Battery type&specification	Battery 1: Model: Li426483PUJLY DC 3.85V, 4280mAh,16.48Wh Battery 2: Model: LiSP426483SHHTT DC 3.85V, 4380mAh,16.863Wh
Rating	DC 3.85V from battery or DC 5V from Adapter.
I/O Ports	Refer to users manual
Hardware Version	TE855-A2-PCB-V1.0

1.2 INFORMATION ABOUT THE EUT

a) The type of modulation used by the equipment:

- FHSS
- other forms of modulation

b) In case of FHSS modulation:

- In case of non-Adaptive Frequency Hopping equipment: The number of Hopping Frequencies:
- In case of Adaptive Frequency Hopping Equipment:
- The maximum number of Hopping Frequencies:
- The minimum number of Hopping Frequencies:
- The (average) Dwell Time:

c) Adaptive / non-adaptive equipment:

- non-adaptive Equipment
- \boxtimes adaptive Equipment without the possibility to switch to a non-adaptive mode
- adaptive Equipment which can also operate in a non-adaptive mode

d) In case of adaptive equipment:

The maximum Channel Occupancy Time implemented by the equipment: ./. ms

- The equipment has implemented an LBT based DAA mechanism
 - In case of equipment using modulation different from FHSS:
 - The equipment is Frame Based equipment
 - The equipment is Load Based equipment
 - The equipment can switch dynamically between Frame Based and Load Based equipment
 - The CCA time implemented by the equipment: / μ s
- The equipment has implemented a non-LBT based DAA mechanism
- The equipment can operate in more than one adaptive mode

e) In case of non-adaptive Equipment:

- The maximum RF Output Power (e.i.r.p.):
- The maximum (corresponding) Duty Cycle:

Equipment with dynamic behaviour, that behaviour is described here. (e.g. the different combinations of duty cycle and corresponding power levels to be declared):

f) The worst case operational mode for each of the following tests:

- RF Output Power
- GFSK
- Power Spectral Density GFSK
- Duty cycle, Tx-Sequence, Tx-gap N/A
- Accumulated Transmit time, Frequency Occupation & Hopping Sequence (only for FHSS equipment)
 N/A
- Hopping Frequency Separation (only for FHSS equipment)
 N/A
- Medium Utilization
 N/A
- Adaptivity
- N/A
- Receiver Blocking
- GFSK
- Nominal Channel Bandwidth
- GFSK
- Transmitter unwanted emissions in the OOB domain
- GFSK
- Transmitter unwanted emissions in the spurious domain GFSK
- Receiver spurious emissions
 GFSK

g) The different transmit operating modes (tick all that apply):

- Operating mode 1: Single Antenna Equipment
 - Equipment with only one antenna
 - Equipment with two diversity antennas but only one antenna active at any moment in time
 - Smart Antenna Systems with two or more antennas, but operating in a (legacy) mode where only one antenna is used (e.g. IEEE 802.11[™] [i.3] legacy mode in smart antenna systems)
- Operating mode 2: Smart Antenna Systems Multiple Antennas without beam forming
 - Single spatial stream / Standard throughput / (e.g. IEEE 802.11™ [i.3] legacy mode)

FCC Registered No.: 463705 IC Registered No.: 9270A-1

CNAS Registration No.:L5516

2.2 MEASUREMENT UNCERTAINTY

For the test methods, according to ETSI EN 300 328 standard, the measurement uncertainty figures shall be calculated in accordance with ETR 100 028-1[4] and shall correspond to an expansion factor(coverage factor) k=1.96 or k=2 (which provide confidence levels of respectively 95 % and 95.45 % in the case where the distributions characterizing the actual measurement uncertainties are normal (Gaussian)).

	Measurement uncertai	nty
No.	Item 🗡	Uncertainty (P=95)
1	Occupied Channel Bandwidth	± 4.7%
2	RF output Power,conducted	± 0.9dB
3	Power Spectral Density, conducted	± 2.6dB
4	Unwanted emissions, conducted	± 2.2dB
5	All emissions, radiated	± 5.3dB
6	Temperature	🔷 ± 0.5℃
7	Mumidity	± 2.0%
8	Time Time	± 1.0%

3.4.3 DEVIATION FROM TEST STANDARD

No deviation

3.4.4 TEST SETUP

According to the EN 300 328 V2.2.2 clause 5.4.8.1: These measurements shall only be performed at normal test conditions. For equipment using FHSS modulation, the measurements shall be performed during normal operation (hopping).

For equipment using wide band modulations other than FHSS, the measurement shall be performed at the lowest and the highest channel on which the equipment can operate. These operating channels shall be recorded.

The equipment shall be configured to operate under its worst case situation with respect to output power.

If the equipment can operate with different Nominal Channel Bandwidths (e.g. 20 MHz and 40 MHz), then each channel bandwidth shall be tested separately.

3.5. ADAPTIVE (CHANNEL ACCESS MECHANISM)

3.5.1 APPLICABILITY OF ADAPTIVE REQUIREMENTS AND LILIT FOR WIDE BAND MODULATION TECHNIQUES Refer to chapter 4.3.2.6 of ETSI EN 300 328 V2.2.2 (2019-07)

		Operational Mode				
		LBT based Detect and Av				
Requirement	Non-LBT based Detect and Avoid	Frame Based Equipment	Load Based Equipment (CCA using 'energy detect')	Load Based Equipment (CCA not using any of the mechanisms referenced as note 2)		
Minimum Clear Channel Assessment (CCA) Time	NA	not less than 18 us (see note 1)	(see note 2)	not less than 18 us (see note 1)		
Maximum Channel Occupancy (COT) Time	<40 ms	1ms to 10 ms	(see note 2)	(13/32)*q ms (see note 3)		
Minimum Idle Period	5 % minimum of 100 μs	5% of COT	(see note 2)	NA		
Extended CCA check	<u>SNA</u>	NA	(see note 2)	R*CCA (see note 4)		
Short Control Signalling Transmissions	Maximur	n duty cycle of 10% (within an observations within an observation see note 5)	on period of 50 ms		

Note 1: The CCA time used by the equipment shall be declared by the supplier.

Note 2: Load Based Equipment may implement an LBT based spectrum sharing mechanism based on the Clear Channel Assessment (CCA) mode using energy detect as described in IEEE 802.11[™]-2012 [i.3], clause 9, clause 10, clause 16, clause 17, clause 19 and clause 20, or in IEEE 802.15.4[™]-2011 [i.4], clause 4, clause 5 and clause 8 providing the equipment complies with the conformance requirements referred to in clause 4.3.2.6.3.4. Note 3: g is selected by the manufacturer in the range [4...32]

Note 4: The value of R shall be randomly selected in the range [1...g]

Note 5: Adaptive equipment may or may not have Short Control Signaling Transmissions.

Interference threshold level

The detection threshold shall be proportional to the transmit power of the transmitter: for a 20 dBm e.i.r.p. transmitter the detection threshold level (TL) shall be equal to or less than -70 dBm/MHz at the input to the receiver assuming a 0 dBi (receive) antenna assembly. This threshold level (TL) may be corrected for the (receive) antenna assembly gain (G); however, beamforming gain (Y) shall not be taken into account. For power levels less than 20 dBm e.i.r.p., the detection threshold level may be relaxed to:

TL = -70 dBm/MHz + 10 × log10 (100 mW / Pout) (Pout in mW e.i.r.p.)

1	Table S	9: Unwanted Signal parameters	25
9	Wanted signal mean power from companion device (dBm)	Unwanted signal frequency (MHz)	Unwanted CW signal power (dBm)
3	-30/ sufficient to maintain the link(see note 2)	2 395 or 2 488,5 (see note 1)	-35 (see note 2)

NOTE 1: The highest frequency shall be used for testing operating channels within the range 2 400 MHz to 2 442 MHz, while the lowest frequency shall be used for testing operating channels within the range 2 442 MHz to 2 483,5 MHz. See clause 5.4.6.1. NOTE 2: A typical value which can be used in most cases is -50 dBm/MHz. NOTE 3: The level specified is the level in front of the UUT antenna. In case of conducted measurements, this level has to be corrected by the actual antenna assembly gain.

3.5.2 TEST PROCEDURE

3.7.3 DEVIATION FROM TEST STANDARD

No deviation

Page 37 of 56 Report No.: STR211122001002E

- 2. Testing was performed when the equipment was in a receive-only mode.
- 3. The measurements were performed when normal hopping was disabled. In this case measurements were performed when operating at the lowest and the highest hopping frequency.
- 4. The test setup has been constructed as the normal use condition. Controlling software has been activated to set the EUT on specific status.

B.7.6 TEST RESULTS (Conducted measurement)

Test data reference attachment

N2017.06.06.0614.V.1.2

3.8. RECEIVER BLOCKING

3.8.1 PERFORMANCE CRITERIA

The minimum performance criterion shall be a PER less than or equal to 10 %. The manufacturer may declare alternative performance criteria as long as that is appropriate for the intended use of the equipment (see clause 5.4.1.t).

3.8.2 LIMITS OF RECEIVER BLOCKING

While maintaining the minimum performance criteria as defined in clause 4.3.2.11.3, the blocking levels at specified frequency offsets shall be equal to or greater than the limits defined for the applicable receiver category provided in table 14, table 15 or table 16.

Wanted signal mean power from companion device (dBm) (see notes 1 and 4)	Blocking signal Frequency (MHz)	Blocking signal power (dBm) (see note 4)	Type of blocking signal
(-133 dBm + 10 × log₁₀(OCBW)) or -68 dBm whichever is less	2 380 2 504	-34	CW
(see note 2) (-139 dBm + 10 × log ₁₀ (OCBW))	2 300	t to a	4 4
or -74 dBm whichever is less	2 330 2 360	t	2
(see note 3)	2524 2584 2674	the way	+ S

Table 14: Receiver Blocking parameters for Receiver Category 1 equipment

NOTE 1: OCBW is in Hz.

NOTE 2: In case of radiated measurements using a companion device and the level of the wanted signal from the companion device cannot be determined, a relative test may be performed using a wanted signal up to Pmin + 26 dB where Pmin is the minimum level of wanted signal required to meet the minimum performance criteria as defined in clause 4.3.1.12.3 in the absence of any blocking signal.

NOTE 3: In case of radiated measurements using a companion device and the level of the wanted signal from the companion device cannot be determined, a relative test may be performed using a wanted signal up to P_{min} + 20 dB where P_{min} is the minimum level of wanted signal required to meet the minimum performance criteria as defined in clause 4.3.1.12.3 in the absence of any blocking signal.

NOTE 4: The level specified is the level at the UUT receiver input assuming a 0 dBi antenna assembly gain. In case of conducted measurements, this level has to be corrected for the (in-band) antenna assembly gain (G). In case of radiated measurements, this level is equivalent to a power flux density (PFD) in front of the UUT antenna with the UUT being configured/positioned as recorded in clause 5.4.3.2.2.
